Schedule and Agenda

- This Thursday (May 22): Lab on regression
- Next Thursday (May 29): Case exam 2 (regression)
  - You will be asked to enter your groups as in Case Exam 1, to give you the opportunity to change your groups.
  - Python help file will be shared this Friday.

- Now:
  - Correlation
  - Multiple linear regression

Inference on the Population Correlation

- Let $(x_1, y_1), \ldots, (x_n, y_n)$ be a random sample from the joint distribution of *X* and *Y* and let *r* be the sample correlation of the *n* points. Then the quantity,

$$W = \frac{1}{2}\ln\frac{1+r}{1-r}$$

is approximately normal with mean,

$$\mu_W = \frac{1}{2}\ln\frac{1+\rho}{1-\rho} \qquad \rho = \frac{e^{2\mu_W} - 1}{e^{2\mu_W} + 1}$$

and variance,

$$\sigma_W^2 = \frac{1}{n-3}.$$

Another approach: Hypothesis test

$H_0: \rho = 0$
$H_1: \rho \neq 0$

$$U = \frac{r\sqrt{n-2}}{\sqrt{1-r^2}} \quad \sim T_{n-2}$$

Example 2

$H_0: \rho \leq 0$
$H_1: \rho > 0$

$$U = \frac{r\sqrt{n-2}}{\sqrt{1-r^2}} = 3.91$$

In a study of reaction times, the time to respond to a visual stimulus (*x*) and the time to respond to an auditory stimulus (*y*) were recorded for each of 10 subjects and r is computed as 0.8159. Times were measured in ms.

P value?

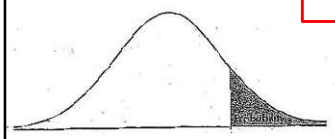

TABLE B: *t*-DISTRIBUTION CRITICAL VALUES

	Tail probability p
